

Throttle Body Cleaning Service Procedure for Drive-by-Wire Applications

When performing a throttle body cleaning procedure on any vehicle equipped with a drive-by-wire throttle system, never spray the throttle cleaner directly onto the throttle body or electronic system controls!

To clean the throttle bore and throttle plate, always follow this procedure:

- Key off.
- Remove the flexible boot from the throttle body.
- Spray a small amount of TBC2 onto a clean shop towel.
- Carefully wipe the throttle body and throttle plate with the shop towel. Make sure you open the throttle plate and clean along the edges.
- Reinstall the flexible boot.

That's all there is to it; the throttle body is clean and ready to go.
