Use the 'Rite' Amount of Shift-Rite Platinum

Shift-Rite Platinum Universal ATF Treatment is formulated to be effective when mixed 1 oz to 1 quart of ATF.

So, when adding Shift-Rite Platinum to a transmission, it's important to know the transmission capacity. If the capacity is, say, 9.2 quarts, a single, 10-ounce bottle of Shift-Rite Platinum will provide the necessary supplements to keep the transmission working like new.

But if the transmission capacity is 14 quarts, you'll need to add 14 ounces of Shift-Rite Platinum, or about one and a half bottles, for proper protection.

Simply adding a bottle without verifying the capacity may leave the transmission with inadequate protection against heat and friction.
